Conclusion

You have been challenged!

How can we leverage Roof tops to address issues
related to climate change?

01 The Big Problem

Adaqueete rainfall is crucial for urban life
however, where does all that water go?

What is this Big Problem?

Flooding Challenges in Urban Areas:

- Frequent **flooding events** disrupt daily life and damage infrastructure. Ie. **Highway 410**.
- Current urban stormwater systems **struggle to handle peak rainwater volumes**.
- **Mississauga's growing urbanization** has reduced permeable surfaces, increasing the risk of flooding.
- Excess rainwater often **overwhelms drainage systems**.
- Climate change is **increasing the intensity and frequency of storms**, exacerbating these issues.

Highway 410 Flooding – July 16, 2024

What are Blue Roofs?

02

01

Summary about Blue Roofs!

The blue roof system is an innovative, distributed solution to alleviate stormwater pressure during peak events.

- **Manages stormwater effectively**
- **Reduces urban flooding** during heavy rainfall.
- **Cost-efficient solution** \$1 – \$2 per square foot.
- **Promotes urban cooling** by reducing rooftop heat and improving air quality.
- **Improves water quality** by filtering out pollutants before release.
- **Supports sustainability goals** by integrating with green infrastructure initiatives.

03 Optimization Model

The graph above shows monthly rainfall intensity against the decision to release or retain stormwater.

Our Optimization Model

- Optimization model for blue roof systems takes in data sets and checks if the blue roof should release or sustain water based on factors.
- To show this works, we provided a simulation model using a front-end application which can display this data and run simulations.
- Machine learning models could predict peak flow times and automatically control the release of water from blue roofs.

How The ML Model Works

- **Data Integration:** We combined rainfall data with information about the stormwater infrastructure (nodes and pipes).
- **Machine Learning Model:** A Random Forest model algorithm was trained to make retention and release decisions based on historical rainfall and infrastructure data in Mississauga.
- **Evaluation:** Compared the outcomes of stormwater captured with and without the machine learning-enabled blue roof system.
- **Results:** Our model predicts when a blue roof should release or retain water to prevent overloading the storm sewer.
